No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

Sequence ends have been trimmed to exclude vector and regions below Phred quality 16. Three-prime sequences are presented as their reverse complement and have been trimmed to exclude polyy.

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in
Library constructed by Dr. Miversity of Tokyo Institute of Medical
Science; plant material and RNA prepared at Texas A & M University,
sequencing done in the Laboratory for Genomics and Bioinformatics,
University of Georgia. Sequence ends have been trimmed to exclude
are presented as their reverse complement and have been trimmed to
exclude polyA.

Seq primer: Sug3 (CGACCTGCAGCACAA)
/clone_lib="Salt-stressed seedlings"
//note="Vector: pWE18S-FL3; Site_1: XhoI; Site_2: XhoI; The library was prepared from polyA+ RNA from 9-day-old seedlings grown in hydroponic culture. Seedlings were transferred to a 150 mM NaCl solution and harvested at 3, 6, 12 and 24 hr following transfer. Roots and leaves were pooled from all time points and RNA isolated.
Double-stranded cDNA was cloned unidirectionally into different DrailI sites of the pME18S-FL3 vector (5-prime DrailI site is CACTGTGTG, 3-prime DrailI site is

/clone="Vector: pSPORTI; Site 1: Sall; Site 2: Not!; Plants
were grown in a glasshouse. Anther meiotic stage was
determined by removing anthers from individual primary
florets. One anther was sacrificed for microscopic
staging, and if determined to be between (and including)
meiotic stages pre-meiosis and metaphase I, the remaining
two anthers were collected and pooled for library
construction. The tissue, total RNA, and poly(A) RNA were
prepared, cDNA synthesised, and directionally ligated into
pSPORTI by Tim Sutton in the P Langridge Lab at the
Department of Plant Science, University of Adelaide, Waite
Campus Australia. Average insert size 1:SKD. Plasmid DNA
preparations and DNA sequencing were performed in the OD
Anderson lab (all other authors)."

Bento Soares, Ph.D. CDNA Library Arrayed by: Greg Lennon, Ph.D. DNA Sequencing by: Washington University Genome Sequencing Center Clone distribution: NCI-CGAP clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: NWW-bio.llnl.gov/bbrp/image/image.html Insert Length: 1155 Std Error: 0.00 Seq primer: -40ml3 fwd. ET from Amersham High quality sequence stop: 164.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /tissue_type="pooled germ cell tumors"
/lab host="Dellog"
/lab host="Thilbs"
/clone_lib="NCI_CGAP_GC4"
/note="Vector: pT713D-pac (Pharmacia) with a modified
polylinker; lst strand cDNA was prepared from 3 pooled
germ cell tumors, and was then primed with a Not I -
oligo (dT) primer. Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified pT7T3
vector. Library is normalized. Library was constructed by
Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mammalia; Butheria; Primates; Catarrhini; Hominidae; Homo.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparastic, protozoacide, cytostatic and immunomodulatory activity. The recombinant adenoviruses are useful as vaccines for eliciting immune response or conferring protection against

New recombinant adenoviruses, useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E, or tumor

infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaria. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-1 strain BH10 antigen construct described in the disclosure of the

The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence

recombinant adenovirus.

```
This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparasitic, protozoacide, cytostatic and useful as immunemodulatory activity. The recombinant adenoviruses are useful as carrier at a ganthogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, cotozoans, e.g. malaria. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaria. The immunactimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-1 strain BHIO antigen construct described in the disclosure of the

The method is useful for enhancing immunity of the host to infections, e.g. influenza, Babola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence is used in the exemplification of the invention.

This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparasitic, protozoacide, cytostatic and immunomodulatory activity. The recombinant adenoviruses are useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Ebola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also to useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaria. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-1 strain BH10 antigen construct described in the disclosure of the

The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence encodes ENV9, a recombinant peptide. ENV9 consists of about 54 amino acids from the N-terminal of a poliovirus sequence (pEXC), as well as those regions of HIV gpl20 and gp41 detailed above. ENV9 can be used to detect HIV antibodies. "False positive" results are minimised as it contains few non-critical antigens. It can also be used in a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant peptide with antigenicity of human immuno-deficiency virus -comprises forty-six amino acids from gp. 120 C-terminal and two hundred and forty amino acids from gp. 41 N-terminal.

```
The plasmid pENV9 was constructed by ligating the BqlII/BamHI fragment (Int 7196-8053) of HIV clone lambda BH10 with the BglII/ BamHI vector fragment of pexc. The prod. was used to transform B. coli strain HB101 and MM294. The transformates produced a protein ENV9 contg. 349 amino acids from the N. terminal of the pollovirus sequence of pEXC, 46 amino acids from the N. terminal of the pollovirus sequence of pexc. 46 amino acids of the C. terminal of the peptide comprises the early detection antigen from gp120 and a highly reactive comprises the early detection antigen from gp120 and a highly reactive antigen from gp121 thus providing broad sensitivity to HIV antibodies. The sensitivity of the peptides permits the detection of HIV infection using secondare to larger antigence segments. The peptides have improved stability as compared to larger antigenic segments and contain fewer noncritical antigens which minimises the possibility of false positive results in detection of HIV infection. The peptides can also be used in vaccines protective against HIV. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoding a HIV antigen - comprising the C-terminal N-terminal of Gp41. for use in diagnosis and in

antigens

```
This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparastic, protozoacide, cytostatic and immunomodulatory activity. The recombinant adenoviruses are useful as infection of a pathogenic antigen, e.g. HIV, Boola virus, hepatitis A, B, C, D or E or tumour antigens, e.g. HIV, Boola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malaria The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-I strain BHIO antigen construct described in the disclosure of the

```
Fusion protein gene comprises the 0.9kbp gene fragment from Pvull site to BgIII site of HTLV-III gag gene, and 1.2kbp gene fragment from BgIII site to Xho I site of HTLV-III env gene. The HIV gag-env protein has the antigenicity of the gag and env proteins. It contains all the peptide domains of gag-p24 and env-gp41 that are esp. important antigens in a vaccine. The eukaryotic expression cell is pref. Saccharomyces cerevisiae. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1669 GTAGTGAATAGAGTTAGGCAGGATATTCACCATTATCGTTTCAGACCCACTCCCAATC 1728

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1177 TTATTCATAATGATAGTAGGAGGCTTGGTAGGTTTAAGAATAGTTTTTGCTGTACTTTCT 1236

This invention describes a novel recombinant adenovirus comprising an HIV sequence encoding an HIV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the HIV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antiparasitic, protozoacide, cytostatic and antibacterial, antiparasitic, protozoacide, cytostatic and munomodulatory activity. The recombinant adenoviruses are useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic antigen, e.g. HIV, Boola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also useful as genetic vaccines against pathogenic bacteria, parasites or protozoans, e.g. malariar. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-1 strain, BHIO antigen construct described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      virucide; hepatotropic; RNA editing; GP gene; vaccine; immunity enhanced; influenza; Ebola; Marburg; Arbovirus; hepatitis; respiratory syncytial virus; herpes simplex virus; human papilloma virus; HIV infection; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of enhancing the immunity of a host to infection of a first and second pathogenic virus comprising administering to the host a first and a second recombinant adenovirus. The method is useful for enhancing immunity of the host to infections, e.g. influenza, Ebola, Marburg, Arbovirus, hepatitis, respiratory syncytial, herpes simplex or human papilloma virus or HIV infections. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 GTAGTGAATAGAGTTAGGGAGGGATATTCACCATTATCGTTTCAGACCCACCTCCCAATC 120

                                                                                                                                                                           The sequence is the result of cloning a hybrid envelope gene from HIV variants BH10 and RF. A central portion of the RF gene was used, the rest being from te distantly related variant BH10. The resulting clone, pAcHT6 produces a hybrid gp 160 envelope protein with novel immunological and antigenic characteristics. It may be used to as a vaccine and for diagnosis and therapy of AIDS. See also AAN80948. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                2094

                                                                                                     dequence encoding an HVV antigen, where expression of the HIV antigen by the recombinant adenovirus elicits an immune response directed against the recombinant adenovirus elicits an immune response directed against the HVV antigen in a host upon infection of the host by the recombinant adenovirus. The products of the invention have anti-HIV, virucide, antibacterial, antiparasitic, protozoacide, cytostatic and immunomodulatory activity. The recombinant adenoviruses are useful as vaccines for eliciting immune response or conferring protection against infection of a pathogenic aminomodulatory activity. Bola virus, hepatitis A, B, C, D or E or tumour antigens. The recombinant adenoviruses are also protozoans, e.g. malaria. The immuno-stimulators are useful for enhancing the immunogenicity of the HIV antigens. This sequence represents an HIV-strain BH10 antigen construct described in the disclosure of the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 78,

Patent No. 6492104

GENERAL INFORMATION:
APPLICANT: CLOYD, MILES W.
APPLICANT: CLOYD, MILES W.
TITLE OF INVENTION: BIA TEST USING NONDENATURED HIV ANTIGEN FOR EARLY
TITLE OF INVENTION: DETECTION OF HIV INFECTION
TITLE OF INVENTION: DETECTION OF HIV INFECTION
CURRENT APPLICATION NUMBER: US/09/325,131B
CURRENT FILING DATE: 1999-06-08
PRIOR APPLICATION NUMBER: 08/728,122
PRIOR APPLICATION NUMBER: 08/143,168
PRIOR FILING DATE: 1996-10-26
NUMBER OF SEQ ID NOS: 1
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 1

/clone lib="WGGs-ZmaygF (DH5a methyl filtered)"
/note="Corgan: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nuclecitie was
added by fill in in the recessive 3' end. The genomic DNA
was nabulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
fractionated using sephadex and were cloned into the vector (:x/y
reads in Milamply, .b/g reads in pUCl9). The same ligation
was transformed into DH5a."

/clone_lib="Gotertagia ostertagi L3 pAMP1 v1"
/note="Vector: pAMP1 (Gibco); Site_1: Not1; Site_2: SalI;
***MARNING: Subsequent examination of these samples has
revealed the presence of an additional Tichostrongyloidea
cattle nematode, Cooperia oncophora. Sequences in this
library may derive from either Ostertagia or Cooperia.**

The library was constructed by Claire Murphy and Dr. James
McCarter at Washington University, St. Louis. The CDNA was
made by using Dynabaad oligo-dT priming (Dynal). PCR based
library using a modified protocol from the SWART PCR CDNA
Synthesis Kit from Clontech. Directionally cloned into the
UDG sites of pAMP1. Nematodes were provided by Dr. Louis
Gasbarree of the USDA, Beltsville, MD
(lgasbarreanri.barc.usda.gov). Third stage exsheathed
larvae were collected from 14 day fecal-sphagnum moss
cultures of Ostertagia eggs. The larvae were recovered by
overnight passage through a 20 micron nylon mesh. The
larvae were then subjected to a treatment with 1.25¢
larvae were then subjected to a treatment which 1.25¢
changes of PBS and then pelleted and snap frozen in
liquid nitrogen."

McCarter at Washington University, St. Louis. The CDNA was made by using a modified protocol from the SMRAR PKR cDNA Synthesis Kit from Clontech. Directionally cloned into the UDG sites of pAMP1. Nematodes were provided by Dr. Louis Gasbarree of the USDA, Beltsville, MD Gasbarree of the USDA, Beltsville, MD (lgasbarrean: barc.usda.gov). Third stage exsheathed larvae were collected from 14 day fecal-sphagnum moss cultures of Ostertagia eggs. The larvae were recovered by overnight passage on a Baermann apparatus, and then cleaned by passage through a 20 micron nylon mesh. The larvae were then subjected to a treatment with L258 and with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /clone libe="Obsertagia ostertagi L3 pAMPI v1"
/clone libe="Ostertagia ostertagi L3 pAMPI v1"
/note="Vector: pAMPI (Gibco); Site_1: NotI; Site_2: SalI;
****MANING: Subbequent examination of these samples has
revealed the presence of an additional Trichostrongyloidea
cattle nematode, Cooperia oncophora. Sequences in this
library may derive from either Ostertagia or Cooperia.**
The library was constructed by Claire Murphy and Dr. James
McCarrer at Washington University, St. Louis. The CDNA was
made by using a modified protocol from the SMART PCR based
library using a modified protocol from the SMART PCR cDNA
library using a modified protocol from the SMART PCR CDNA
library using a modified brotocol from the SMART CR CDNA
Synthesis Kit from Clontech. Directionally cloned into the
UDG sites of pAMPI. Nematodes were provided by Dr. Louis
Gasbarree of the USDA, Beltsville, MD
(lgasbaraanri.barc.usda.gov). Third stage exsheathed
larvae were collected from 14 day fecal sphagnum moss
cultures of Ostertagia eggs. The larvae were recovered by
overnight passage through a 20 micron nylon mesh. The
larvae were then subjected to a treatment with 1.25¢
cholor to induce excystation. The larvae were washed with
standary and then pelleted and snap frozen in
